There was a factor of 2π omitted in the conversion of the experimental result into a limit on parameters of the standard-model extension. Therefore, the measured value of $R = 53 \pm 45$ nHz correctly translates into a value of $\tilde{b}_{\perp}^n = (6.4 \pm 5.4) \times 10^{-32}$ GeV, which is smaller than the published value by a factor of 2π .
